

The successful and sustainable development of groundwater resources is critical to the future of safe water supplies in Africa in addition to economic and social improvement and food security across the continent.

This depends on a good understanding of groundwater and hydro-geology. But most often, high quality information about groundwater in Africa – even where it exists – is hard to find.

The Africa Groundwater Map will help tackle this by increasing awareness and availability of information about groundwater in Africa, in individual countries and at a continental scale.
